Acknowledgments

This report was compiled by Peter Braun. Contributions from a number of colleagues are gratefully acknowledged.

Ann Peut, Diane Gibson and Penny Allbon of the Australian Institute of Health and Welfare provided critical comments and other valuable assistance with the compilation of the report.

Technical support and advice from within the Australian Institute of Health and Welfare was given by Geoff Davis and Prema Orugallu of the Data and Information Technology Unit.

Thanks are due to colleagues in the Ageing and Aged Care Division of the Australian Government Department of Health and Ageing. In particular, members of the Management Information and Data Analysis Section (MIDAS) team headed by Dr David Martin have contributed in various ways.

Thank you to Cecilia Burke and Ainsley Morrissey for arranging publication of the report.

Summary

The number of residential aged care places increased from 161,765 at 30 June 2005 to 166,291 places at 30 June 2006. The 166,291 places include 2,273 places provided by Multi-Purpose Services and places funded under the Aboriginal and Torres Strait Islander Aged Care Strategy. There were a total of 2,931 mainstream residential aged care services with an average number of funded places per service of 60.

The provision ratio of residential aged care places per 1,000 persons aged 70 years and over increased from 85.3 at 30 June 2005 to 85.6 at 30 June 2006. The planning target ratio is currently 88. Including community services covered by the Aged Care Act (1997), the corresponding ratio of places and packages increased from 102.5 to 105.8 during the 12 month period to 30 June 2006, relative to the planning target of 108.

The highest state/territory provision ratio for residential aged care was South Australia (92.2), and the lowest was the Australian Capital Territory, (72.1). Provision was lower in outer regional (76.2) and remote areas (65.7).

Fifty-three per cent of the 154,872 residents at 30 June 2006 were aged 85 years and older, continuing the upward trend over time in the age profile of residents. Women comprised 72% of the residential aged care population and 58% of these female residents were aged 85 years and over compared with 38% of male residents. Overall, about 4% of residents were less than 65 years in age.

In terms of dependency, 69% of residents at 30 June 2006 were assessed as high care and 63% of admissions over the year from 1 July 2005 to 30 June 2006 were initially assessed as high care. At the point of separation over the same year, 86% of residents had high-care status.

There were 102,691 admissions to residential aged care between 1 July 2005 and 30 June 2006, excluding transfers. 52,964 admissions were for ongoing care and the remainder were for shorter term respite care. There were 50,720 separations after a period of permanent care; the most common reason for separation was death (87%). There were 49,402 separations after a period of respite care; the vast majority of these residents (78%) returned to the community.

The average completed length of stay was 145.8 weeks for permanent residents and 3.1 weeks for respite residents.

Usage rates at 30 June 2006 were calculated for a number of groups in permanent residential aged care. Usage rates increase substantially at older ages, varying from 6 people per thousand at ages 65–69 to 237 per 1,000 at ages 85 and over. Usage rates are higher for Indigenous people than for non-Indigenous people in every age group, although the difference is smaller at older ages. Amongst those aged 65–69 years, the rate for Indigenous people was 17 per 1,000 compared to 6 per 1,000 for non-Indigenous people. At age 75 years and over, the rates were 105 per 1,000 for Indigenous people and 101 per 1,000 for non-Indigenous people.

1 Overview

This report presents statistics on the Australian residential aged care system over the period 1 July 2005 to 30 June 2006. It is the ninth such report in the Aged Care Statistics Series produced by the Ageing and Aged Care Unit of the Australian Institute of Health and Welfare, under an agreement with the Australian Government Department of Health and Ageing.

Australia's aged care system is structured around two main forms of formal care delivery: residential and community care. Both forms of care continue to expand in absolute terms as the population of older people who require assistance grows.

The number of residential aged care places has increased, but there is a continuing strong emphasis on the provision and evaluation of innovative and flexible community care to help people stay in their own homes. There are two community care programs which aim to deliver the equivalent of care provided in the residential aged care sector to people living in the community.

Community Aged Care Packages (CACPs) provide care for frail or disabled older people whose dependency and complex care needs would qualify them for entry to an aged care service, at least for low-level care. The Extended Aged Care at Home (EACH) program aims to deliver care at home that is equivalent to high-level residential care. This program began as a pilot in 2000, but is now established as an ongoing program. In 2005, \$225.1m in funding was announced to support the development of 2,000 EACH Dementia packages (EACHD) over three years, and 667 EACH Dementia packages were allocated in the Aged Care Approvals Round to 30 June 2006. At 30 June 2006, there were 601 operational EACH Dementia packages.

Recently, a new program has been introduced to provide short-term support and active management for older people at the interface of the acute/sub-acute and residential aged care sectors. The Transition Care Program (TCP) provided 595 places at 30 June 2006. It provides goal-oriented, time-limited assistance, and focuses on older people at the conclusion of a hospital episode who require more time and support in a non-hospital environment to complete their restorative process, optimise their functional capacity and finalise and access their longer term care arrangements. In addition to these programs, a large amount of community care is provided via the Australian Government and state/territory funded Home and Community Care (HACC) program. In 2004–2005, an estimated 744,197 people received assistance from the HACC program.

This publication is primarily concerned with residential aged care. The section on provision of aged care places, however, also includes data on CACPs, EACH packages and TCP places as all these programs are included in the Australian Government's provision ratio target for aged care. Access to assistance from each program requires a recommendation from an Aged Care Assessment Team (ACAT).

This chapter presents data on the provision of places and packages, including data on allocated places for recent financial years. Chapter 2 reports data on the number, size and location of residential aged care services, while Chapter 3 examines patterns of service use by residents, including admissions and separations. Chapter 4 describes characteristics of residents as at 30 June 2006, and characteristics of newly admitted and separated residents

during 2005–06. Three appendices provide additional time series data, population data and notes on the data and their limitations.

Cases where data are not applicable, unknown or not reported have been excluded in relevant calculations of percentages and rates presented in the text.

Operational places and packages

Residential aged care provision increased in absolute terms from 161,765 places at 30 June 2005 to 166,291 places at 30 June 2006 (Table 1.1). In the same period the provision of Community Aged Care Packages (CACPs) rose from 30,973 to 35,383. At 30 June 2005 a total of 1,673 packages under the Extended Aged Care at Home (EACH) program was available. This increased to 2,580 EACH packages and 601 EACH Dementia packages, at 30 June 2006.

In addition to reporting provision by mainstream services, the data in this section of the report also incorporates aged care places and packages delivered by Multi-Purpose Services and services receiving flexible funding under the Aboriginal and Torres Strait Islander Aged Care Strategy. The exception is the data about allocated places (see Figure 1.1), which only includes mainstream service allocations.

In 2004, the Australian Government increased the planning target for aged care provision to 108 places and packages per 1,000 persons aged 70 years and over. Of these 108 places and packages, 88 are targeted to residential aged care, (40 to high-care places and 48 to low-care places), and 20 to CACPs and EACH packages. The previous target was 100 places and packages per 1,000 persons aged 70 years and over, comprising 50 low-care places, 40 high-care places and 10 CACPs. The provision ratio measures operational places and packages per 1,000 persons aged 70 years and over, and now also includes TCP places.

The combined provision ratio declined in the late 1980s and early 1990s, but stabilised in the mid-to-late 1990s at around 93–94 places and packages per 1,000 persons aged 70 years and over (AIHW 1995:381–2; AIHW 1997:384–5). Since 2001, the ratio has risen each year as a consequence of new aged care places and packages being made available (see Table 1.1 and Figure 1.1).

The combined ratio of residential aged care places, CACPs, EACH packages, EACH Dementia packages and TCP places per 1,000 persons aged 70 years and over, increased from 102.5 at 30 June 2005 to 105.8 at 30 June 2006. The provision ratio for each type of care program increased over this period: the residential aged care ratio increased from 85.3 to 85.6; the CACP ratio from 16.3 to 18.2; and the EACH ratio from 0.9 to 1.6. The EACH ratio also includes 601 EACH Dementia packages. The TCP contributed 595 places at 30 June 2006, which added 0.3 when included in the Australia-wide provision ratio.

Table 1.1: Number of operational residential aged care places, CACPs and EACH packages, and transition care places, and the provision ratio per 1,000 persons aged 70 years and over^(a) from 30 June 1995 to 30 June 2006

Year	Places and packages					Provision ratio				
	Residential aged care	CACP	EACH	Transition care	Total	Residential places	CACP ratio	EACH	Transition care	Total ^(a)
1995	134,810	2,542	137,352	92.2	1.7	93.9
1996	136,851	4,431	141,282	90.6	2.9	93.5

2001	144,013	24,629	168,642	82.2	14.0	96.2
2002	146,268	26,425	172,693	81.7	14.8	96.4
2003	151,181	27,881	255	..	179,062	82.8	15.3	98.1
2004	156,580	29,063	860	..	186,503	84.2	15.6	0.5	..	100.3
2005	161,765	30,973	1,673	..	194,411	85.3	16.3	0.9	..	102.5
2006	166,291	35,383	3,181	595	205,450	85.6	18.2	1.6	0.3	105.8

(a) The ratios are based on Australian Bureau of Statistics (ABS) population estimates released in December 2006, cat. no. 3101.0, and are recalculated back to 1997 (ABS 2006a).

Notes

1. The 2006 EACH total includes 601 EACH Dementia packages.
2. The ratios for 2006 differ from those published by the Australian Government Department of Health and Ageing which, for reporting in 2006, used small area projections based on the ABS 2002 Population Projections, Series B.
3. From 1999, the data in this table include places and packages provided by Multi-Purpose Services and flexible funding under the Aboriginal ... Not applicable

State and territory variations

The residential aged care provision ratios at 30 June 2006 showed some variation by state and territory. Provision ratios were highest in South Australia (92.2), the Northern Territory (91.9), Tasmania (88.0), Queensland (86.3), and Victoria (86.1). Western Australia (84.5), New South Wales (83.7) and the Australian Capital Territory (72.1) had the lowest ratios of residential aged care provision.

The combined ratios of all aged care places and packages per 1,000 persons aged 70 years and over at the state/territory level were: Northern Territory (213.7), South Australia (112.7), Tasmania (109.0), Victoria (106.2), Queensland (105.5), Western Australia (104.5), New South Wales (103.2), and the Australian Capital Territory (97.5) (Table 1.3).

The higher level of provision in the Northern Territory is a consequence of a comparatively young population profile and a relatively large Indigenous population. As a result of their poorer health status, Indigenous people access aged care programs at younger ages, on average, than do non-Indigenous people. If the population figures used in the denominator to calculate the places ratio include Indigenous people aged between 50 years and 69 years, as well as the general population aged 70 years and over, a different picture emerges. For the Northern Territory, the ratio for residential aged care reduces from 91.9 to 46.7, whereas the aggregate Australian ratio reduces only from 85.6 to 83.6. The combined ratio reduces from 213.7 to 108.6 in the Northern Territory, while the ratio for Australia reduces only from 105.8 to 103.3.

Allocated places and packages to approved providers

The preceding reporting of provision at 30 June 2006 provides a snapshot of capacity in these sectors of aged care service. Aged Care Approval Rounds cater for the ongoing provision of new places and packages that is needed to achieve the planning targets, as detailed earlier. There are time lags between residential places, EACH packages and CACPs being approved, allocated and then becoming operational. Service providers who receive an allocation of new places and/or packages are required to make them operational within two years or the places are either reallocated or renegotiated.

There have been a significant number of new residential places, CACPs and EACH packages allocated to approved providers from recent Aged Care Approvals Rounds. In the round concluding 30 June 2005, from a total allocation of 11,825 places and packages, 45% were allocated to low-care places, 30% to high-care places, 17% to CACPs and 8% to EACH packages. In the year to 30 June 2006, the primary allocation from the planning round announced on 15 December 2005 comprised 11,112 places and packages consisting of 28% low-care places, 19% high-care places, 39% CACPs and 14% EACH packages (Figure 1.1). The allocation of EACH packages included 667 Dementia-specific packages. The data supporting Figure 1.1 were supplied by the Australian Government Department of Health and Ageing and data for the current reporting year may be found on their website at <www.health.gov.au>. No allocations were dated in the 1997-98 financial year.

Further statistics about CACPs and EACH packages over the same reporting period will be published as a separate report in this series (AIHW 2007). Other detailed information about CACP and EACH care recipients and the type of assistance they receive was last collected in 2002 (see AIHW 2004).

(a) Refers to the location of the places. The table uses the ASGC Remoteness Structure as developed by the ABS.

(b) Includes 601 EACH dementia packages. For more information see (AIHW 2007).

n.a. Not applicable.

Notes

- These figures include places and packages provided by Multi-Purpose Services and places and packages funded under the Aboriginal and Torres Strait Islander Aged Care Strategy.
- The 2006 ASGC Remoteness population figures were derived at the AIHW from the 2005 ASGC Remoteness population figures and the ABS estimated resident population figures for state/territories, 30 June 2006 released in December 2006 (ABS 2001 and 2006a). The Indigenous population aged 50–69 years uses ABS projections (ABS 2004).

2 Residential aged care services

As at 30 June 2006, there were 2,931 mainstream residential aged care services in Australia providing a total of 164,008 places. Also at 30 June 2006, Multi-Purpose Services provided 1,951 residential care places, and services receiving flexible funding under the Aboriginal and Torres Strait Islander Aged Care Strategy provided 332 residential care places. At 30 June 2005, the comparable figures were 159,532 mainstream residential aged care places, 1,901 residential care places from Multi-Purpose Services and 332 residential care places from services receiving flexible funding under the Aboriginal and Torres Strait Islander Aged Care Strategy. Australia wide, there were 94 Multi-Purpose Services and 22 services receiving flexible funding under the Aboriginal and Torres Strait Islander Aged Care Strategy. Not all these services provided packages or places.

Because of the flexible nature of the services provided by Multi-Purpose Services and services receiving flexible funding under the Aboriginal and Torres Strait Islander Aged Care Strategy, only limited data are available on these services. Consequently, the remainder of this report presents data on mainstream residential aged care services only.

The number of mainstream services has declined since 30 June 1998 when a total of 3,015 services provided residential aged care. At the same time, the corresponding number of operational places has risen from 139,917 to 164,008. This led to an increase in the average number of places per facility from 46.4 at 30 June 1998 to 60.0 at 30 June 2006.

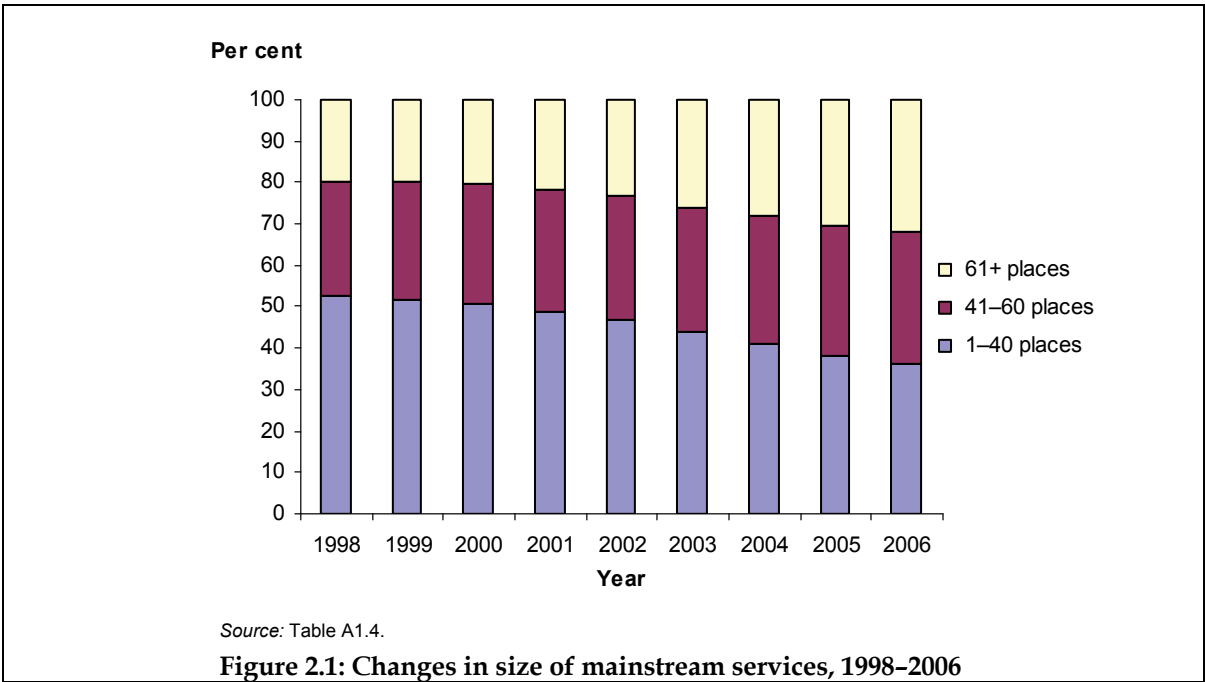

Figure 2.1 illustrates changes in the size of aged care services since 30 June 1998. At that date, services with 61 or more places accounted for 20% of total services; at 30 June 2006, 32% of services had 61 or more places. There was a reduction in the number of services with 40 or fewer places, from 1,590 in 1998 to 1,064 in 2006. In 1998, 53% of services were in this size range, while in 2006 they accounted for 36% of services (Table A1.4).

The size of aged care services differed across jurisdictions. At the larger end of the continuum were services in the Australian Capital Territory (averaging 69 places per service), New South Wales (60) and Queensland (59). Below the Australian average for beds per service (56), were Western Australia (54), South Australia (52) and Victoria (52). At the smaller end of service size were services in Tasmania (48) and the Northern Territory (29) (AIHW, unpublished data).

Sixty-five per cent of services in the Australian Capital Territory had more than 60 places. In the Northern Territory nearly half the services (47%) had 20 or fewer places, and there were no services in that Territory with more than 60 places. Tasmania also had a comparatively large proportion of small services with 20 or fewer places (17%), (Table 2.2).

To some extent these state/territory patterns were associated with geographic differences: 61% of services in remote areas and 81% of services in very remote areas had 20 or fewer places and most of the remainder in these regions had 40 or fewer places. In the Northern Territory, 60% of services were located in remote and very remote regions. Services in regional areas also tended to be smaller than those in major cities. Eighty-six per cent of services in outer regional areas and 73% of services in inner regional areas had 60 or fewer places compared with 61% of services in major cities. Tasmania had no services categorised as major city location, while all services in the Australian Capital Territory were categorised as major city services (Tables 2.1 and 2.3).

Type of organisation providing services

At a national level, the main providers of residential aged care services were religious organisations (29%), private providers (26%), community-based providers (17%) and charitable organisations (15%), (Table 2.4). The profile of organisational types of service providers varied considerably across states and territories (Figure 2.2). In the Australian Capital Territory, 48% of services providers were charitable organisations compared with the next highest rate of charitable organisations which was in South Australia and New South Wales (22%). In the Northern Territory and Queensland, high proportions of services were operated by religious organisations – 53% and 46% respectively.

Commercial, religious and charitable organisations were most highly represented in major cities at 36%, 33% and 16%, respectively. Community-based services were most prominent in remote areas (46%), outer regional areas (34%) and very remote areas (29%), (Table 2.5).

3 Patterns of use

This section explores various aspects of residential aged care use and some of the dynamics of the system. In particular, rates of usage of residential aged care for various population groups are examined. Other measures of use are also provided, including occupied bed-days and average occupancy between 1 July 2005 and 30 June 2006. System dynamics are explored through reporting two measures of length of stay, and resident turnover during the year, along with admissions to and separations from residential aged care.

Usage rates

Overall, usage rates for permanent residential aged care increase with age. They are higher for women than men, particularly among older age groups. For the Australian population at 30 June 2006, the group aged 85 years and over had the highest rate of use at 237.0 persons per 1,000. The corresponding measures for the age groups 80–84 and 75–79 were 81.2 and 33.3 per 1,000, respectively (Table A1.3).

Age-specific usage rates for permanent residential aged care have also been calculated for different sub-groups in the Australian population based on the Australian Bureau of Statistics (ABS) 2001 census (estimated resident population) and ABS population projections. Usage rates for the Indigenous population also rise with age. However, the usage rates for Indigenous people are significantly higher at younger ages than for the non-Indigenous population, and are generally higher than the corresponding rates for non-Indigenous people in all age groups.

For the Indigenous population, these rates at 30 June 2006 were 17.4 per 1,000 Indigenous persons aged 65–69 years, 27.8 per 1,000 aged 70–74 years, and 105.2 per 1,000 aged 75 years and over (Table 3.4). Rates for non-Indigenous people were 5.9 per 1,000 non-Indigenous persons aged 65–69 years, and 13.1 per 1,000 persons aged 70–74 years, and 101.0 per 1,000 persons aged 75 years and over.

Based on Australian Institute of Health and Welfare (AIHW) projections of ABS estimated resident population by country of birth, the number of Australian-born people receiving permanent care at 30 June 2006 was estimated to be 56.7 per 1,000 persons aged 75–84 years and 248.2 per 1,000 aged 85 years and over. The corresponding rates for English-speaking people who were born overseas were 49.0 and 237.9 per 1,000, respectively, and the corresponding usage rates for overseas born people from culturally and linguistically diverse backgrounds were 46.4 and 183.8 per 1,000 respectively, (Table 3.3). Overall usage rates (50+) were highest for Australian-born people.

Resident occupied place-days

During the 12-month period from 1 July 2005 to 30 June 2006, 56.0 million place-days were used in aged care services in Australia, consisting of 54.9 million days for permanent care and just below 1.1 million days for respite care (Table 3.5). Two per cent of occupied place-days were used for respite purposes. Respite days compared with total days varied somewhat across the states and territories, with the smallest proportions provided in Queensland and Western Australia (1.3% and 1.4%, respectively) and the highest in the

Northern Territory (5.8%). The corresponding rate for respite occupied place-days also varied with remoteness, from 1.8% in major cities to 4.0% in very remote areas.

Occupancy

The overall occupancy rate ranged from 93.0% in Victoria to 97.9% in the Australian Capital Territory (Table 3.6). Australia-wide, the occupancy rate was 95%, which was a slight decrease from the previous year (96%). The occupancy rate was 95% in major cities, and 96% in inner and outer regional areas. It was 93% in remote areas and 85% in very remote areas. Over the last 8 years the occupancy rate at the national level has oscillated in a narrow band between 95% and 96%. Over these years, Victoria, Western Australia and the Northern Territory have regularly shown relatively lower occupancy rates, with averages over the eight years of 94.4%, 94.8% and 93.7%, respectively. On the other hand, Tasmania, Australian Capital Territory and South Australia have had relatively higher occupancy rates of 97.4%, 96.7% and 97.3%, respectively (Table A1.5).

Length of stay

Two standard measurements related to length of stay are the total or completed length of stay of a separated resident up to the point of leaving residential aged care, and the length of stay of an existing resident up to a particular point in time (in this publication, up to 30 June 2006). It should be noted that for existing residents, length of stay is an incomplete measure, showing the time that residents have already spent in residential aged care, but not how much more time will be spent before leaving. It also excludes residents who only stayed a short time during 2005–06 and had already left residential aged care at 30 June 2006. This latter group is, however, included in the measure of completed length of stay.

The distribution of length of stay for existing permanent residents at 30 June 2006 was towards longer periods of stay (Table 3.7). Only 8% of permanent residents had been in residential aged care for less than 3 months. Nineteen per cent had been resident for between 3 months and 1 year, 52% for 1 to 5 years and 21% for 5 years or more.

For completed length of stay, 19% of permanent residents stayed less than 3 months, with 20% staying between 3 months and 1 year. Forty-three per cent of permanent residents stayed between 1 and 5 years before separation, with 18% staying over 5 years (Table 3.9).

The average (mean) length of stay for permanent residents separating from residential care between 1 July 2005 and 30 June 2006 was 167.4 weeks for women and 109.2 weeks for men. In aggregate, the average length of stay was 145.8 weeks (Table 3.10). The length of stay of residents at the time of separation varied among the states and territories. Permanent separations in the Australian Capital Territory had the longest average length of stay (157.8 weeks) and those in Western Australia had the shortest (140.5 weeks).

For those leaving respite care during the year under review, the average length of stay was 3.1 weeks – the same as in the previous 3 years (Table 3.11). In this group, the average length of stay varied from 2.2 weeks in Tasmania to 3.6 weeks in New South Wales. The longest average length of stay was in very remote areas (4.5 weeks).

From 1998–99 to 2005–06, average completed length of stay for permanent residents has increased overall from 131.3 weeks to 145.8 weeks. On the other hand, average completed

length of stay for respite care declined from 3.5 weeks in 1998–99 to 3.1 weeks in 2002–03 (Table 3.1). It has remained stable since then (Table 3.1).

Table 3.1: Admissions, separations and completed length of stay in residential aged care, 1998–99 to 2005–06

	Permanent admissions	Respite admissions	Permanent separations	Respite separations	Complete length of stay (permanent, weeks)	Complete length of stay (respite, weeks)
1998–99	45,258	40,806	44,079	40,939	131.3	3.5
1999–00	45,476	42,531	44,615	42,422	137.0	3.3

2004–05	52,462	48,295	48,503	48,120	143.3	3.1
2005–06	52,964	49,727	50,720	49,402	145.8	3.1

Note: Transfers are excluded from admissions and separations.

Turnover

The amount of turnover in the system is a function of the number of admissions, length of stay and the overall growth, or reduction, in the size of the system. Generally, the turnover for permanent and respite residents have been relatively stable over the last 8 years and fluctuated in narrow bands according to changes in these factors. The apparent decrease in respite turnover in 2005–06 is probably due to a limitation in the simple method used to estimate turnover, as there were an unusually high number of respite residents at 30 June 2006. Nevertheless, this method has indicated a small decrease in respite turnover since 2002–03.

Approximately one-third of permanent places are associated with new admissions in a year, whereas nominal respite places are used by about 15 to 17 people per year (Table 3.2).

Table 3.2: Admissions and turnover, by type of care in residential aged care services, 1999–2006

Type of care	Residential care							
	1999	2000	2001	2002	2003	2004	2005	2006

Admissions	86,064	88,007	90,151	90,654	96,645	99,988	100,757	102,691
Turnover	0.61	0.62	0.63	0.63	0.65	0.64	0.63	0.63

Note: Turnover is calculated separately for permanent and respite residents by firstly allocating permanent and respite places according to the number of residents in each category as at 30 June. Turnover is defined as admissions divided by places.

Admissions and separations

Permanent care

There were 102,691 admissions to residential aged care between 1 July 2005 and 30 June 2006, of which 52% (52,964) were for permanent care (Table 3.1). In 1998–99 there were fewer (86,064) admissions, but nearly the same proportion (53%), were admissions for permanent care. Between 1 July 2005 and 30 June 2006 there were 100,122 separations from residential aged care. Separations after a period of permanent care totalled 50,720, which accounted for 51% of total separations. There were fewer separations in 1998–99 (85,018), but a similar proportion (52%), were after a period of permanent care.

The reasons for separation are given as: death, return to community, admission to hospital, move to another aged care service and other. For 2005–06, permanent separations had 1.5% of persons in the 'other' category and for respite, 13.9% of separations were in the 'other' category.

For those persons whose reason for separation is specified for 2005–06, death was the major reason for separation from permanent care (87%), while 4% returned to the community, 4% moved to another residential aged care service and 5% were discharged to hospitals (Table 3.13). Among those who died, 17% had stayed for less than 3 months, 19% for between 3 months and 1 year, 45% for 1 to 5 years and 20% for 5 years and more (Table 3.15). People leaving residential aged care after a shorter period of stay were more likely to return to the community and less likely to die in residential aged care than those with longer periods of stay.

There was also variation across states and territories with respect to destination on separation. The Australian Capital Territory and Tasmania had the highest percentage of permanent separations through death (95%), while Western Australia and the Northern Territory had the lowest percentage of separations through death (83% and 84%, respectively). Western Australia had the highest percentage separating to hospital (7%), (Table 3.13).

Respite care

On 30 June 2006, respite residents made up 2.0% of all residents (Tables 4.2 and 4.4). This figure under-represents the importance of respite care, however, as it accounted for some 48% of 102,961 admissions from 1 July 2005 to 30 June 2006 (Table 3.1). This is explained by the short-term nature of respite care; while there were a large number of admissions for respite care (49,727) over the course of the 12-month period, there were relatively few respite residents at any one point in time. For example, there were 3,135 respite residents at 30 June 2006.

About 14% of respite separations had an unspecified destination on departure from residential care (Table 3.14). Of those persons for whom the destination on separation was specified, 78% returned to the community, 5% were discharged to hospitals and less than 2% died. A continuation of residential care at a different facility accounted for 15% of those separating. These residents may be moving to permanent care, either in the same service or a new service or additional respite care in a new service.

For respite residents, state and territory variations in destination on separation were also evident (Table 3.14). After excluding those with an unspecified destination, Tasmania, the

Northern Territory and Victoria had the highest proportions returning to the community (89%, 86% and 84%, respectively), while South Australia and Western Australia had the lowest (73%). The Australian Capital Territory also had a high proportion returning to the community (80%).

A common pattern is that those states and territories with lower rates of return to the community tended to have higher rates of movement to another residential aged care service. Excluding unknown data, South Australia, New South Wales and Western Australia had higher rates moving to further residential aged care and lower rates returning to the community.

Table 3.3: Age- and sex-specific usage rates for permanent residents, by English-speaking status, based on country of birth, 30 June 2006 (per 1,000 population)

Sex/age	Australian-born	Overseas-born, English-speaking	Overseas-born, non-English- speaking	Total
Females

Notes

1. Recipients with unknown status have been pro rated.
2. Ratios are calculated using ABS migration statistics (ABS 2006b).
3. Due to the unavailability of regular population estimates by language preference, English-speaking status is based on country of birth. People born in Australia, Ireland, United Kingdom, New Zealand, United States of America, Canada and South Africa are assumed to be from an English-speaking background.

Table 3.4: Age- and sex-specific usage rates for permanent residents,^(a) by Indigenous status, 30 June 2006 (per 1,000 population)^(b)

4 Resident characteristics

Residents at 30 June 2006

There were 154,872 residents in residential aged care services at 30 June 2006, compared with 151,910 residents in aged care services at 30 June 2005 and 134,899 residents at 30 June 1999 (Tables 4.2 and A1.1). Over half (53%) of the residents in aged care services at 30 June 2006 were aged 85 years and over. In 1999, 49% were aged 85 years and over (Table A1.1). This pattern was similar across the states and territories, with the exception of the Northern Territory where just 29% of residents were aged 85 years and over. Residents of services in remote and very remote areas tended to have a younger age profile, with 44% aged 85 years and over in remote areas and 31% aged 85 years and over in very remote areas (Table 4.5).

Nationally, there were 6,735 residents aged less than 65 years accommodated in aged care services, comprising 4% of all residents. For the Northern Territory, however, the proportion of residents aged less than 65 years was considerably higher at 15% (Table 4.2). The higher proportion is to be expected given the proportion of Indigenous Australians in the Northern Territory. Aged care planning for Aboriginal and Torres Strait Islander people is based on those 50 years and over in light of their poorer health status. In remote areas, 9% of residents were under 65 years of age, while in very remote areas 18% of residents were under 65 years of age. In other regions, the representation of this age group was near the national average of 4% (Table 4.5).

The majority of residents (72%) were female (Table 4.2). Female residents were on average older than male residents: 58% of female residents were 85 years of age or older, compared with 38% of male residents.

Permanent residents

The majority (98%) of residents in aged care services on 30 June 2006 were permanent residents (151,737). For permanent residents, 53% were aged 85 years and over. Females were more highly represented in this age group with 58% aged 85 years and over (Tables 4.2 and 4.3).

Marital status

About 98% of permanent residents reported their marital status before admission. Of these, 57% were widowed at the time of admission, 25% were either married or in a de facto relationship, 10% had never married and 7% were divorced or separated (Table 4.6). Female permanent residents were over twice as likely to be widowed, and less than half as likely to be married or in de facto relationships, than their male counterparts.

A lower proportion of permanent residents in the Northern Territory were widowed (52%) than in any other jurisdiction, while a higher proportion of Northern Territory permanent residents were single (15%) or separated (6%).

Data about current marital status are not available.

Indigenous status

Of the 95% of permanent residents for whom data were recorded on Indigenous status, 872 (about 0.6%) identified as Indigenous people (Table 4.8). Only 57% of Indigenous permanent residents were female, compared with 71% of female non-Indigenous residents.

The Northern Territory reported the highest proportion of Indigenous people among its permanent residents (41%). Although Queensland recorded only 1% of permanent residents as having Indigenous status, it had the highest number of Indigenous residents (255).

Pension status

A high proportion of permanent residents were in receipt of a government pension. Seventy-one per cent of residents received a Centrelink pension and 18% an Australian Government Department of Veterans' Affairs (DVA) pension (Table 4.10). Female permanent residents are more likely to receive a Centrelink pension (72%) than males (69%). On the other hand, a higher proportion of male residents receive a DVA pension – 20% of males receive this pension compared with 17% of women.

Self-funded retirees comprised 10% of permanent residents and there was little difference between males and females. The Australian Capital Territory had a higher proportion of self-funded retirees (21%) among its permanent residents compared with other states and territories. The only states above the Australian average were New South Wales (12%) and South Australia (10%). The Northern Territory (5%) and Tasmania (7%) had the lowest proportion of self-funded retirees.

Concessional and assisted residents

Residents with relatively low levels of income and assets are given assistance to access residential aged care. For residents who meet the eligibility criteria for concessional status, a concessional supplement is paid to the service provider, and the resident pays no accommodation charge or bond.

The supplement for assisted residents is lower, and, unlike a concessional resident, an assisted resident may be required to pay an accommodation bond or an accommodation charge, subject to certain conditions. All residential aged care services are required to provide care to a minimum ratio or proportion of residents who are concessional or assisted. These ratios vary by aged care planning region.

At 30 June 2006, 35% of permanent residents had concessional status and 4% were assisted. The Northern Territory had the highest proportion of concessional residents (67%) followed by Western Australia (39%). The Australian Capital Territory had the lowest proportion of concessional residents (31%). The proportion of concessional residents was also higher in remote and very remote areas (45% and 64%, respectively), compared with major cities (35%), inner regional areas (34%) and outer regional areas (38%), (Tables 4.11 and 4.12).

Country of birth and preferred language

Over 99% of all permanent residents had their birthplace and preferred language recorded. Of these, about 26% of residents were born overseas; 11% were born in the United Kingdom and Ireland, and another 11% in 'other' areas of Europe (Tables 4.13).

Western Australia and the Australian Capital Territory had the highest proportions of overseas-born permanent residents (39% and 36%, respectively) and Tasmania had the lowest (16% (Table 4.13). Nationally, 91% of permanent residents indicated that English was their preferred language, while 8% preferred other European languages (Table 4.15). Among permanent residents, the Northern Territory had the highest proportion preferring a language other than English, with 34% having this preference (including 26% who preferred an Australian Indigenous language) (Table 4.15). Queensland and Tasmania reported small proportions of permanent residents preferring a language other than English (3%), while remaining states and the Australian Capital Territory were closer to the Australian average.

Respite residents

Only 3,135 residents in aged care services on 30 June 2006 were receiving respite care, representing just below 2% of all residents (Table 4.4). The age profile of respite residents was younger than that of permanent residents. Only 43% of respite residents were aged 85 years and over, with a further 40% aged between 75 and 84 years. A lower proportion of respite residents were female (64%) compared with permanent residents (72%).

The age-sex profile of respite residents varied across states and territories. In the Northern Territory, 17% of respite residents were aged 65 years or under, whereas all other state and territories were close to the Australian figure of 6%. Also, in the Northern Territory only 34% were aged 85 years and over, whereas most other state and territories were close to the Australian figure of 43%. The age profile of respite residents was oldest in Tasmania, where 52% of respite residents were aged 85 years and over.

For those where marital status was recorded, a higher proportion of respite residents were either married or in a de facto relationship (33%) compared with permanent residents (25%), (Tables 4.6 and 4.7). A marginally smaller proportion of respite residents compared with permanent residents were widowed, but this group still comprised more than half of respite residents (54%).

Indigenous status was well reported, with only 0.2% of missing data. Of those persons for whom Indigenous status was reported, just over 1% identified as Indigenous (Table 4.9).

Twenty-eight per cent of respite residents were born overseas, and their country of birth profile was similar to that for permanent residents. Nationally, 88% of respite residents indicated that English was their preferred language, while 10% preferred other European languages, especially Southern European languages (Tables 4.14 and 4.16).

Newly admitted residents 2005–06

There were 51,752 people admitted at least once to residential aged care services for permanent care during 2005–06 (Table 4.20), and 35,306 people were admitted for respite care at least once during the same period (Table 4.21).

People admitted for respite care were slightly younger than those admitted for permanent care, with 66% of respite admissions aged 80 years and over compared with 71% of permanent admissions (Tables 4.18 and 4.19). There has been a steady increase in the proportion of newly admitted residents aged 80 years and over since 1998–99, when 60% of people admitted for respite care, and 64% of people admitted for permanent care, were aged 80 years and over (Table A1.2).

Permanent residents admitted between 1 July 2005 and 30 June 2006 were more likely to be married or in a de facto relationship (31%), compared with all permanent residents on 30 June 2006 (25%), (Tables 4.6 and 4.20). While the vast majority of people admitted for permanent or respite care were either married or widowed, those admitted for respite care were more likely to be married than those admitted for permanent care (36% and 31%, respectively) (Tables 4.20 and 4.21).

A high proportion of newly admitted residents had been living in a house or flat before admission during the reporting period: 77% of permanent residents and 85% of respite residents for whom these data was reported (Tables 4.22 and 4.23).

For those residents where information about prior outside living arrangements were relevant and available, 49% of admitted permanent residents lived alone prior to their admission, 46% lived with family and 5% lived with others (Table 4.24). Residents admitted for respite care differed considerably from those admitted for permanent care with regard to their living arrangements. While residents admitted for respite care were less likely to be living alone than those admitted for permanent care, it is noteworthy that 39% of respite admissions were for people living alone at the time of entry (Table 4.25). This was particularly true of women: 48% of women admitted for respite were living alone compared with 25% of men.

The proportion of newly admitted permanent residents who were receiving an Australian Government Department of Veterans' Affairs pension was marginally higher at 19% than for all permanent residents at 30 June 2006 (18%). The corresponding proportions of people receiving a Centrelink pension were 68% and 71%, respectively (Tables 4.26 and 4.10).

Dependency levels

Resident dependency levels are indicated by the Resident Classification Scale (RCS). The RCS has eight categories which represent eight levels of care in descending order of need from 1 to 8. The level of Australian Government care subsidy is based on the level of care need indicated by each RCS category. No basic subsidy is paid for residents in category RCS 8. Categories 1 to 4 represent high-care status and categories 5 to 8 represent low-care status.

Among permanent residents on 30 June 2006, 1,223 (0.8%) did not have an assessment recorded on the database. Of those who did have their dependency level reported, 69% were in high-care categories (RCS 1 to 4) and 31% in low-care categories (RCS 5 to 8). RCS categories 1, 2 and 3 comprised the highest proportion of permanent residents (23%, 24% and 15%, respectively). The lowest level of care (RCS 8) contained 0.4% of residents at 30 June 2006 (Table 4.28).

Tables 4.29 and 4.30 both examine resident dependency at 30 June 2006, but the former focuses on younger ages and the latter on older ages. In the 65+ age group, which contain the majority of residents, there were few differences between male and female residents in relation to dependency levels. A higher proportion of young residents were classified as high dependency. For example, 42% of residents aged under 40 years were classified RCS 1 compared with 23% of those over 65 years and over. Generally, the proportions of residents in the RCS 1 and RCS 2 categories decreased significantly with increasing age (Table 4.29).

Between 30 June 1998 and 30 June 2006, there was a consistent increase in the proportion of residents classified as high care (RCS 1 to 4) from 58% to 69%, while the proportion of those classified as low care (RCS 5 to 8) fell from 42% to 31% (Table 4.1). This decline has been most marked in RCS 8, reflecting an increasing emphasis on providing services to those with

personal care needs, rather than primarily accommodation needs. From 1998 to 2006, the proportion in RCS 8 has dropped from 5% to 0.4% and the proportion in other low care (RCS 5 to 7) has dropped from 38% to 31% (Table 4.1). Available residential care places have thus been aimed at a progressively more dependent group of people. During this same period, the supply of Community Aged Care Packages, aimed at providing the equivalent of low care residential support to people still living in their homes, has expanded significantly. This pattern is in keeping with established government policy, which aims to provide a greater proportion of care for people in their homes who would otherwise be eligible for low-care residential support.

Table 4.1: Dependency levels of permanent residents in residential aged care services, 30 June 1998 to 30 June 2006 (per cent)

Sex/year	RCS 1–RCS 4 high care	RCS 5–RCS 7 funded low care	RCS 8 nil basic subsidy	RCS 5–RCS 8 low care

Sources: AIHW 2006 and Table 4.29.

The dependency profile of newly admitted residents during 2005–06 provides a useful indication of possible future trends in residential care. The dependency levels of admitted permanent residents during the period suggest that we may expect similar proportions of people in residential aged care at high-care levels in the future. After excluding the 2,866 residents whose dependency levels were not available, 63% of admitted permanent

residents were classified as high-care and 37% as low-care (Table 4.27). The proportion of those admitted as high-care residents is lower than for existing residents (69%), as admitted residents are, by definition, at the beginning of their residential aged care stay – some will progress to higher levels of dependency during the course of their stay.

As would be expected, the dependency levels of residents who left residential care were much higher than those for both current and admitted residents (Table 4.32). After excluding 1,477 residents whose RCS at separation could not be determined, eighty-six per cent who left permanent care during 2005-06 were classified as high-care residents.

The increase in dependency in many residents during their stay in aged care is apparent when we consider that 20% of new admissions were categorised as RCS 1, but 23% of current residents at the end of June 2006 were in the RCS 1 category, and 38% of separations during that year were in that category (Tables 4.27, 4.28 and 4.32).

(a) Refers to the location of the services.

Notes

1. 'DVA' refers to the Australian Government Department of Veterans' Affairs. Other pensions are administered by Centrelink.
2. The category 'Unknown' refers to residents not yet assessed by Centrelink or DVA at the time of reporting.
3. The table supplied by the Australian Government Department of Health and Ageing (DoHA) has been adjusted slightly to retain consistency with other tables as different updates of the data were used (see Appendix 3).

(a) Each person is counted once regardless of the number of admissions the resident had during the period. The status at the first admission is reported.

(b) Refers to the location of the services.

Notes

- 1 'DVA' refers to the Australian Government Department of Veterans' Affairs. Other pensions are administered by Centrelink.
- 2 The table was supplied by DoHA and has been adjusted to retain consistency with other tables in the section.
- 3 The category 'Unknown' refers to clients not yet assessed by DVA or Centrelink.

(a) Each person is counted once regardless of the number of separations the resident has during the period. The last length of stay is the length of stay evaluated from the last separation in the period. Transfers are not regarded as separations.

Note: This table excludes 1,477 residents whose dependency levels were not reported.

Appendix 1: Additional time series data

Table A1.1: Trends in resident numbers at 30 June, 1999 to 2006

Year	All permanent residents	All respite residents	Permanent residents (85+)	Respite residents (85+)	Permanent residents (85+)(%)	Respite residents (85+)(%)
1999	132,420	2,479	64,638	903	48.8	36.4
2000	133,387	2,604	66,503	1,034	49.9	39.7

(a) The table is derived using the January 2004 population estimates of the ASGC Remoteness Structure as developed by the ABS, and population estimates from the state/territory ABS estimated resident population at 30 June 2006, released in December 2006 (ABS 2001, 2006a).

Appendix 3: Data and their limitations

The main source of data in this report is administrative by-product data from the System for the Payment of Aged Residential Care (SPARC).

SPARC contains information gathered through a number of instruments. Among those instruments, the following three are directly relevant to this report:

- 'Aged Care Application and Approval' – a form completed by a person applying for admission to an aged care service or by someone (normally a carer) on behalf of the applicant
- 'Application for Classification' – a form containing the Resident Classification Scale (RCS) and completed by the aged care service to determine the resident's overall level of care needs
- 'Monthly Claim Form' – a form for claiming Australian government benefits completed by the aged care service as part of the monthly funding cycle.

Residential aged care in Australia was restructured in 1997–98. The two separate categories of residential care (nursing homes and hostels) were combined into a single program from 1 October 1997. As a result, the two previous data collection systems (the Nursing Home Payment System (NHPS) and the Commonwealth Hostel Information Payment System (CHIPS)) were replaced on 1 October 1997 by SPARC.

The new system inherited all existing records on the NHPS at 1 October 1997. For the data on CHIPS, only those records that related to the following two groups of people were carried over:

1. Those who were in a hostel at 1 October 1997
2. Those who had a valid Aged Care Assessment Team (ACAT) assessment covering 1 October 1997; they were regarded as potential residents.

In other words, the records for residents discharged from hostels before 1 October 1997 are not available on SPARC, although they are still available on CHIPS.

Under the amalgamated residential aged care system, length of stay refers to the period spent in the combined system, which may include both time spent under low care (previously hostel) and high care (previously nursing home). This is not comparable to combining length of stay measures from the previous separate nursing home and hostel measures of length of stay.

Population data are from the AIHW's general population databases supplied by the ABS.

Resident information

All residents admitted to residential aged care must have a valid Aged Care Application and Approval form completed by an authorised ACAT officer. This form is valid for 12 months from the date of the approval.

The information entered into SPARC from the Aged Care Application and Approval form is the major source for the following data items in the tables:

- sex
- date of birth
- marital status
- pension status
- Indigenous status
- country of birth
- preferred language
- resident's usual residence (before admission)
- resident's usual living arrangement (before admission).

Not all residents have all the above characteristics reported on SPARC.

Resident Classification Scale

The RCS application form is forwarded to state/territory offices of the Australian Department of Health and Ageing by aged care services for each resident admitted. On the basis of the information provided, residents are assigned to one of eight service-need categories for the purpose of funding. Normally, the RCS for a client is reviewed on the annual anniversary of admission by the service provider.

Admission and separation date

The monthly claim form is sent to approved services each calendar month as part of the payment cycle. It shows claim details for the previous month plus a 'forecast' schedule for the current month. The service checks the information and records data on separations and absences (hospital and social leave) for these residents. It also adds information on any newly admitted residents for the current month.

The claim form is the source for the following data items in the tables:

- date of admission
- date of separation
- separation mode
- admission type.

Calculation of provision ratios

As noted at Table 1.1, the ratios for 2006 differ from those published by the Australian Government Department of Health and Ageing, which used small-area projections based on the 2001 census for reporting purposes in 2006.

Populations used in the tables in this report

It should be noted that tables in this publication refer to several different sub-populations and, consequently, may not be directly comparable. The sub-populations covered in the tables in this report are summarised below. Excluding the reporting on provision, the data presented relate to mainstream services and their residents and exclude residents in places

provided by Multi-Purpose Services or funded through flexible funding under the Aboriginal and Torres Strait Islander Aged Care Strategy.

Residents at 30 June 2006

All tables on this topic relate to the number of residents who were in mainstream aged care services on 30 June 2006. This population includes all approved residents and totalled 154,872.

All admissions and separations, 1 July 2005 to 30 June 2006

There were 52,964 admissions for permanent care (permanent admissions) and 49,727 admissions for respite care (respite admissions) over the period from 1 July 2005 to 30 June 2006. Over the same period, there were 50,720 separations of permanent residents and 49,402 separations of respite residents. Transfers within type of admission are excluded.

Admitted residents, 1 July 2005 to 30 June 2006

Each person is counted once. For the full year reporting, there were 51,752 distinct resident admissions for permanent care and 35,306 distinct resident admissions for respite care. Transfers within type of admission are excluded.

Separated permanent residents, 1 July 2005 to 30 June 2006

Each person is counted once. For the full year reporting, there were 49,967 distinct resident separations. Transfers of a similar type are excluded.

Tables on dependency

The data on RCS dependency invariably contains some missing data, which are excluded from the tables and the detail is footnoted with the tables.

Data limitations

It should be noted that the accuracy of some specific data items may be limited. Such cases are listed below:

- A reported date of birth implying that a resident is less than or equal to 10 years old is regarded as an input error and 100 years is added to the age. This only alters a handful of entries in any one year.
- Death indicator: in some cases, aged care services may not be equipped to care for some terminally ill residents. Accordingly, such residents are transferred to acute-care institutions before death; hence, there is an under-enumeration of discharges due to death.
- Length of stay: complete length of stay of a resident is the time between the date of admission and the date of separation, and for residents at 30 June 2006, incomplete length of stay is the time between the date of admission and 30 June 2006. When a person is transferred from one service to another, the date of admission to the first service is the date from which the length of stay is calculated.
- The data on the number of residential places and community care packages stored in the Aged and Community Care Management Information System (ACCMIS) are sensitive to dates of entry and ACCMIS is updated on a weekly basis from SPARC. Consequently

the reader may find minor reporting variations depending on the version of ACCMIS used in the variety of reports on aspects of residential aged care.

- Information on whether an admission was from an acute hospital, previously available on NHPS, is not available on SPARC; therefore, relevant tables are no longer included.

Glossary

Admission day

The first day of a person's stay in an aged care service. In the case of a person transferring between services, where the time between leaving one service and entering another is less than 2 days, it is the date of the initial admission. Permanent and respite admissions are treated separately. For example, if a person transfers from a respite stay to a permanent stay, a new permanent admission is created.

Aged Care Assessment Team (ACAT)

A multidisciplinary team of health professionals responsible for determining eligibility for entry to residential aged care.

Assisted residents

See *concessional residents*.

Care recipient

A person assessed by an Aged Care Assessment Team as having significant care needs, which can be appropriately met through the provision of residential care, community care, and/or flexible care.

Concessional residents

Minimum requirements to be a concessional resident at a point in time are that the resident must

- be receiving an income support payment
- not have owned a home for the past 2 years
- have assets of less than 2.5 times the annual single basic aged pension, rounded to the nearest \$500.

The criteria for determining assisted resident status are the same as concessional resident status except that:

- an assisted resident has assets of between 2.5 and 4 times the annual single basic aged pension amount, rounded to the nearest \$500.

For a full description of the ramifications for residents and providers regarding assisted and concessional status, see 'The Residential Aged Care Manual' maintained by the Australian Government Department of Health and Ageing and also available for viewing on their website <www.health.gov.au>.

High-care residents

A high-care resident is one who is assigned to classification levels 1-4 using the Resident Classification Scale.

Hostel for the aged

A hostel is a care service in which residents receive hostel care or personal care services, unless designated as a co-habitee. In this publication, all references to hostels are to hostels for the aged; that is, those hostels designed to provide services to older people. A small number of young people with disabilities live in hostels for the aged. Hostels specifically established for young people with a disability are not included in this publication. Following the introduction of the *Aged Care Act 1997* hostels no longer exist as legal entities. Current practice in the Australian Government Department of Health and Ageing is to refer to both former nursing homes and former hostels as 'residential aged care homes', 'residential aged care services' or 'residential aged care facilities'.

Length of stay

The length of stay of a separated resident is based upon the time between the date of admission and the date of separation, allowing for transfers. For a current resident, it is the time between the date of admission and 30 June 2006. The admission day and the specified day (30 June 2006) are included, but the separation day is excluded, from the calculation of length of stay.

Low-care residents

A low-care resident is one who is assigned to classification levels 5–8 using the Resident Classification Scale.

Nursing home for the aged

These include all nursing homes approved under the *National Health Act 1963*, other than nursing homes for disabled people. In this publication, all references to nursing homes are to nursing homes for the aged. There has been a small number of young people with disabilities living in nursing homes for the aged. Following the introduction of the *Aged Care Act 1997* nursing homes no longer exist as legal entities. Current practice in the Australian Government Department of Health and Ageing is to refer to both former nursing homes and former hostels as 'residential aged care homes', 'residential aged care services' or 'residential aged care facilities'.

Permanent admission

A permanent admission is an admission to residential aged care for probable long-term care purposes.

Permanent care

A resident in residential aged care is under permanent care if this resident entered the service as a permanent admission.

Permanent resident

A resident who is admitted to residential aged care for permanent care (long-term care).

Personal Care Assessment Instrument (PCAI)

Under the previous system of residential care, hostels forwarded to Australian Government offices the PCAI for each resident who may have been eligible for a personal care subsidy. On the basis of the information provided, residents were assigned to one of three service-

need categories for the purpose of funding. The three categories were Personal Care High, Personal Care Intermediate and Personal Care Low. The PCAI categories were used in previous reports in this series to measure the level of dependency based on the assumption that the level of dependency positively relates to the level of care needs. This classification system has been replaced by the Resident Classification Scale (RCS) (see below).

Place-day

A place-day is a day on which a care recipient is occupying a place. The day that a care recipient enters residential aged care and the day he or she leaves are counted as one day.

Remoteness

The remoteness classification used in this report is based on the Australian Standard Geographical Classification Remoteness Structure developed by the Australian Bureau of Statistics. This categorises all Census Collection Districts (CDs) in Australia according to their remoteness, based on physical road distance to the nearest urban centre. Remoteness is measured by the Accessibility/Remoteness Index of Australia (ARIA) (ABS 2001). The structure of the classification is as follows:

Major cities	CDs with an average ARIA index value of 0 to 0.2
Inner regional	CDs with an average ARIA index value greater than 0.2 and less than or equal to 2.4
Outer regional	CDs with an average ARIA index value greater than 2.4 and less than or equal to 5.92
Remote	CDs with an average ARIA index value greater than 5.92 and less than or equal to 10.53
Very remote	CDs with an average ARIA index value greater than 10.53.

Resident

A resident is a person who has been assessed by an Aged Care Assessment Team as requiring residential care and who resides in an Australian government-funded aged care service.

Resident Classification Instrument (RCI)

The RCI was, under the previous system, forwarded to Australian Government offices by nursing homes for each resident admitted. On the basis of the information provided, residents were assigned to one of five service-need categories for the purpose of funding. Category 1 represented the highest level of care needs and category 5 the lowest. The RCI categories were used in previous reports in this series to measure the level of dependency based on the assumption that the level of dependency positively relates to the level of care needs. This classification system has been replaced by the Resident Classification Scale (RCS) (see below).

Resident Classification Scale (RCS)

The RCS is an instrument which assesses a care recipient’s care needs. This scale has eight classification levels ranging from low care (RCS 8) to high care (RCS 1), with each level having a specified subsidy level which is paid to the provider for providing the required care to the care recipient. The RCS was introduced with the amalgamation of hostels and nursing

homes into one system of care on 1 October 1997, replacing the RCI (nursing homes) and the PCAI (hostels).

Residential aged care service

A service that consists of a number of approved places at a specific location.

Residential care

Personal and/or nursing care that is provided to a person in a residential care service in which the person is also provided with accommodation that includes meals, cleaning services, furniture and equipment. The residential aged care service must meet certain building standards and appropriate staffing in supplying the provision of that care and accommodation.

Respite admission

A respite admission is a short-term admission to residential aged care for respite care purposes.

Respite care

Respite care is care given as an alternative care arrangement with the primary purpose of giving the carer or a care recipient a short-term break from their usual care arrangement.

Respite resident

A respite resident is one who is admitted to residential aged care for respite care.

Separation

A separation occurs when a person is discharged from residential aged care and has not re-entered the same or another service within 2 days.

Separation day

A separation day is the last day of a person's stay in an aged care service; that is, the day on which the person leaves the service. Transfers between services were not viewed as separations in terms of length of stay calculations if the time between leaving one service and entering another was less than two days.

Separation mode

The separation mode indicates the destination of a resident at separation, including death.

SPARC

The System for the Payment of Aged Residential Care (SPARC) is the current payment system for residential aged care.

Transfer

A transfer occurs where a person leaves an aged care service on one day and is admitted to another within 2 days.

Usual housing status

Usual housing status refers to housing tenure before the resident's application for admission to residential aged care.
